

From: Dr V. Rajwalla (houseofficer to Mr Lewis)

Here's an updated physical from today's Neurology OP appointment. As mentioned per phone, patient had been managing on crutches until today, then stated he could no longer balance on these and now refusing to use them. Using wheelchair currently. Thanks for seeing him.

Updated Findings on today's physical:

Remains well. Scar well-healed to (R) knee. No inflammation or pain.

Systems interrogation other than (R) leg all normal.

Physical examination entirely NAD other than (R) lower leg.

Central NS normal – cranial nerves remain intact. Coordination and balance still appear normal despite his statements that he cannot balance on crutches. ? malingering?

Peripheral NS: No change. both arms and (L) leg entirely normal. No abnormalities on sensation (touch and pain), proprioception, tone, power, reflexes. Still no wasting or fasciculation.

(R) leg: No change - appearance normal, no wasting or fasciculation. No abnormal movements. Patient still reports complete loss of sensation (touch, pain) in stocking pattern, below knee. Proprioception remains normal. Minimal voluntary movement (slight movement at knee on ++ encouragement), tone normal, plantars both normal.

Normal movement at hip – able to lift leg normally.
